## ISL28194EVAL1Z, ISL28195EVAL1Z Evaluation Board User's Guide

## Introduction

The ISL28194EVAL1Z, ISL28195EVAL1Z evaluation board is a design platform containing all the circuitry needed to characterize critical performance parameters of the ISL28194 and ISL28195 operational amplifiers, using a variety of user defined test circuits.

The ISL28194 and ISL28195 micro-power operational amplifiers feature ultra-low power consumption, rail-to-rail input and output drive capability, and are designed to operate with two 1.5V Alkaline batteries.

## Evaluation Board Key Features

The ISL28194EVAL1Z, ISL28195EVAL1Z is designed to enable the IC to operate from a single supply, +1.8 VDC to +5.5 VDC or from split supplies, $\pm 0.9 \mathrm{VDC}$ to $\pm 2.75 \mathrm{~V}$. The board is configured for a single op amp connected for differential input with a closed loop gain of 10 . It also contains a single external reference voltage (VREF) pin and provisions for a user-selectable voltage divider (filter are included).

## Power Supplies (Figure 1)

External power connections are made through the V+, Vand Ground connections on the evaluation board. For single supply operation, the V- and Ground pins are tied together to the power supply negative terminal. For split
supplies $\mathrm{V}+$ and V - terminals connect to their respective power supply terminals. De-coupling capacitors $C_{1}$ and $\mathrm{C}_{2}$ connect to ground through $\mathrm{R}_{1}$ and $\mathrm{R}_{21} 0 \Omega$ resistors. Resistors $R_{20}$ and $R_{24}$ are $0 \Omega$ but can be changed by the user to provide additional power supply filtering, or to reduce the voltage rate-of-rise to less than $\pm 1 \mathrm{~V} / \mu \mathrm{s}$. Two additional capacitors, $\mathrm{C}_{3}$ and $\mathrm{C}_{4}$ are connected close to the part to filter out high frequency noise. Anti-reverse diodes $D_{1}$ and $D_{2}$ protect the circuit in the case of accidental polarity reversal.

## User-Selectable Options

## (Figures 3 and 4)

Component pads are included to enable a variety of user-selectable circuits to be added to the amplifier inputs, the VREF input, outputs and the amplifier feedback loops.

A voltage divider and filter option (Figure 3) can be added to establish a power supply-tracking common
mode reference at the VREF input. The inverting and non-inverting inputs have additional resistor placements for adding input attenuation, or to establish input DC offsets through the VREF pin.
The output (Figure 4) has additional resistor and capacitor placements for loading.
